RE: Flambeau Mining Company - WPDES Permit No. WI-0047376-1
Acute & Chronic Toxicity Test Battery Results

Dear Mr. Bauman:

Pursuant to Flambeau Mining Company's (Flambeau) WPDES Permit No. WI-0047376-1 Condition E. (7), Flambeau is submitting the results of acute and chronic toxicity test batteries performed on Outfall 001 discharge December 9 - 17, 1993 and acute test batteries performed December 21 - 25, 1993 and January 6 - 10, 1994. The test batteries were performed by Integrated Paper Services.

The initial test battery was performed during the period December 9 - 17, 1993. As previously reported to the Department in a letter dated December 17, 1993, two of three test species passed the acute bioassay. The Ceriodaphnia dubia at 50% effluent produced a 100% survival rate and at 100% effluent produced a 10% survival rate. Upon notification of the results Flambeau immediately began investigating the potential cause of the positive toxicity experienced by the C. dubia as discussed in a report of Flambeau's investigation dated January 11, 1994. The chronic toxicity test battery resulted in no chronic effect.

In accordance with Flambeau's WPDES permit, two additional acute test batteries were performed on Outfall 001 discharge. These test batteries were performed during the periods December 9 - 17, 1993 and January 6 - 10, 1994. The results of the two test batteries showed no evidence of toxicity according to Flambeau's WPDES Permit compliance criterion.

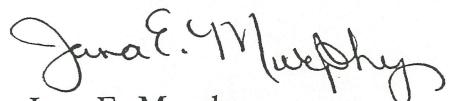

Mr. Tom Bauman

Ladysmith, WI 54848

Dear Jana:

Enclosed please find the final report on the outfall 001 effluent acute and chronic test batteries (using the WDNR split samples) we performed on your behalf during December 9-17, 1993.

An acute toxicity positive result was obtained for Ceriodaphnia; all other results were toxicity negative (i.e., \geq 50% acute survival in 100% effluent and chronic IC₂₅'s \geq IWC) according to permit compliance criteria.

Supplemental tests conducted on these samples will be issued under separate cover (report in progress).

Please call if you have any questions or comments.

Best regards.

Sincerely,

A handwritten signature in cursive ink that appears to read "Dave".

Effluent Bioassays For
Flambeau Mining Company
Ladysmith, Wisconsin

(IPS Project 5000-601)

INTRODUCTION

This report presents the results of a biological assessment of treatment plant effluent quality conducted by Integrated Paper Services, Inc. (IPS). This study was conducted on behalf of Flambeau Mining Company (Flambeau) during the period of December 9-17, 1993.

An acute/chronic bioassessment was implemented to

- 1) estimate the acute toxicity of plant effluent to the cladocerans, Ceriodaphnia dubia and Daphnia magna, and the fish, Pimephales promelas, using the definitive format of the U. S. Environmental Protection Agency (EPA) acute protocols (1), and
- 2) estimate the chronic toxicity of plant effluent diluted to an instream waste concentration (IWC) of 1% and additional concentrations of 10%, 30%, 60%, and 100% (v:v) to the cladoceran, C. dubia, and the fish, P. promelas, using a modified EPA format for chronic toxicity testing (2,3).

Acute toxicity in these tests is defined as greater than fifty percent mortality to C. dubia or D. magna at 48 hours exposure, or to P. promelas at 96 hours exposure. Chronic toxicity was determined using the EPA IC₂₅ endpoint. It is defined as a 25 percent reduction, from control, in C. dubia reproduction or in P. promelas growth (biomass = total replicate dry weight/number of larvae used to initiate the replicate) as measured using linear interpolation.

Positive test results are defined, by WPDES Permit, as acute toxicity in 100% effluent or chronic toxicity at < IWC.

METHODS

IPS methods, including test organism culture, quality assurance, sample handling, test procedures, and data analyses were in accordance with EPA and Wisconsin Department of Natural Resources (WDNR) procedures (1-4). These tests were undertaken as described in the QA/QC plan submitted pursuant to Flambeau's current WPDES Permit No. WI-00047376-1 and approved by the WDNR (changes from the original plan are in accordance with the December, 1992 modified permit).

SAMPLE COLLECTION AND PREPARATION

Effluent for the tests consisted of three composite samples [split samples from Wisconsin Department of Natural Resources (WDNR) composites]; control/dilution water was a Flambeau River grab sample. These samples were collected by Flambeau personnel (Table 1), iced and delivered to IPS within 38 hours of collection.

Table 1. Sample collection schedule for Project 5000-601.

Sample	Type	Collection Dates	Test Use Days
Effluent	12-hr Comp.	12/7	Chronic(1-2)/Acute(1-2)
Effluent	13.5-hr Comp.	12/8	Chronic(3-5)/Acute(3-4)
Effluent	14.5-hr Comp.	12/13	Chronic(6-7)
River	Grab	12/8	Chronic(1-7)/Acute(1-4)

Sample temperatures were measured and recorded upon receipt; total residual chlorine was measured on and a NH₃-N sample taken [and preserved (5) if necessary] from effluent samples upon receipt. Samples not used immediately for test initiation or solution renewal were placed in cold storage (4° C) until needed. All samples were filtered through a 63μ mesh sieve to remove interfering organisms prior to test use.

LABORATORY ANALYSIS

Laboratory procedures followed appropriate protocols and special requirements (1-3). Test conditions are summarized in Tables 2-6. Dissolved oxygen, pH, and conductivity were measured initially and after 24-hours exposure on all test solutions. Total hardness and total alkalinity were measured initially each day on control and highest effluent concentration renewal solutions. Test temperature was monitored hourly by thermocouple thermometry in all exposure areas.

Acute tests were concluded by counting the surviving organisms in each test chamber. In addition, the surviving secondary control fish were sacrificed (exposed to 70% ethanol) and total length and wet weight measurements were made to determine the loading rate.

C. dubia daily survival and reproduction data were tallied at the conclusion of the Ceriodaphnia chronic test. Upon conclusion of the P. promelas chronic test, the surviving fish in each chamber were counted, sacrificed (exposed to 70% ethanol), dried at 100° C

(minimum time 3 hours), and weighed by replicate to the nearest 0.01 mg. C. dubia reproduction and P. promelas biomass data were subjected to IC_p analysis (4).

Table 2. Summary of test conditions for the acute toxicity test with Ceriodaphnia dubia.

1. Test organism:	<u>Ceriodaphnia dubia</u> (Crustacea:Cladocera)
2. Test type:	Static renewal
3. Age of test organisms:	Less than 24 hours
4. Test chamber size:	1 oz
5. Test solution volume:	15 mL
6. Renewal of test solutions:	Daily
7. Replicate chambers/treatment:	4
8. Test organisms/chamber:	5
9. Control/dilution water:	Primary - Flambeau River Secondary - Flow-through culture water
10. Effluent test concentrations:	6.25, 12.5, 25, 50 & 100% (v:v)
11. Temperature:	20 +/- 2° C
12. Feeding regime:	None
13. Aeration:	River and effluent initially to reduce D.O. supersat.
14. pH adjustment:	None
15. Test duration:	48 hours
16. Effects measured:	Mortality (Immobilization)

TEST VALIDATION AND RESULTS

PHYSICOCHEMICAL PARAMETERS

Effluent temperature upon receipt at the laboratory was $\leq 1.2^{\circ}\text{ C}$. Dechlorination of effluent samples was not necessary (total residual chlorine $< 0.02\text{ ppm}$). Physicochemical parameters measured

Table 3. Summary of test conditions for the acute toxicity test with Daphnia magna.

1. Test organism:	<u>Daphnia magna</u> (Crustacea:Cladocera)
2. Test type:	Static renewal
3. Age of test organisms:	Less than 24 hours
4. Test chamber size:	100 mL
5. Test solution volume:	50 mL
6. Renewal of test solutions:	Daily
7. Replicate chambers/treatment:	2
8. Test organisms/chamber:	10
9. Control/dilution water:	Primary - Flambeau River Secondary - Flow-through culture water
10. Effluent test concentrations:	6.25, 12.5, 25, 50 & 100% (v:v)
11. Temperature:	20 $\pm 2^{\circ}\text{ C}$
12. Feeding regime:	None
13. Aeration:	River and effluent initially to reduce D.O. supersat.
14. pH adjustment:	None
15. Test duration:	48 hours
16. Effects measured:	Mortality (Immobilization)

during the bioassays satisfied requirements for aquatic life and the bioassays (1,2). Test exposure temperatures were within protocol specified ranges (Table 7). Chain-of-custody forms with sample collection information, chemical data sheets for the bioassays, and laboratory bench sheets are appended to this report.

Table 4. Summary of test conditions for the acute toxicity test with Pimephales promelas.

1. Test organism	<u>Pimephales promelas</u> (Osteichthyes: Cyprinidae)
2. Test type:	Static renewal
3. Age of test organisms:	Juvenile, 26 days
4. Test chamber size:	1 L
5. Test solution volume:	750 mL
6. Renewal of test solutions:	Daily
7. Replicate chambers/treatment:	2
8. Test organisms/chamber:	10
9. Control/dilution water:	Primary - Flambeau River Secondary - Dechlorinated tap water
10. Effluent test concentrations:	6.25, 12.5, 25, 50 & 100% (v:v)
11. Temperature:	20 +/- 2° C
12. Feeding regime:	None
13. Aeration:	River (days 1-4) and effluent (days 1 & 2) initially to reduce D.O. supersat.
14. pH adjustment:	None
15. Test duration:	96 hours
16. Effects measured:	Mortality

Table 5. Summary of test conditions for the chronic toxicity test with Ceriodaphnia dubia.

1. Test organism:	<u>Ceriodaphnia dubia</u> (Crustacea:Cladocera)
2. Test type:	Static Renewal
3. Age of test organisms:	Less than 24 hours, all released within an 8-hour period, same generation from even-aged parents
4. Test chamber size:	1 oz (plastic cup)
5. Test solution volume:	15 mL
6. Renewal of test solutions:	Daily
7. Replicate chambers/treatment:	10
8. Test organisms/chamber:	1
9. Control/dilution water:	Primary - Flambeau River Secondary - Moderately hard synthetic water
10. Effluent test concentrations:	1, 10, 30, 60 & 100% (v:v)
11. Temperature:	25 +/- 1° C
12. Feeding regime:	0.1 mL "YCT"/day 0.1 mL Algae/day
13. Aeration:	River and effluent initially to reduce DO supersat.
14. pH adjustment:	None
15. Test duration:	7 days
16. Effects measured:	Survival and reproduction
17. Endpoint:	IC ₂₅ at time of 3rd brood release by ≥ 60% of surviving test controls

Table 6. Summary of test conditions for the chronic toxicity test with Pimephales promelas.

1. Test organism:	<u>Pimephales promelas</u> (Osteichthyes: Cyprinidae)
2. Test type:	Static Renewal
3. Age of test organisms:	Larval, less than 24 hours
4. Test chamber size:	600 mL
5. Test solution volume:	250 mL
6. Renewal of test solutions:	Daily
7. Replicate chambers/treatment:	4
8. Test organisms/chamber:	10
9. Control/dilution water:	Primary - Flambeau River Secondary - Moderately hard synthetic water
10. Effluent test concentrations:	1, 10, 30, 60 & 100% (v:v)
11. Temperature:	25 +/- 1° C
12. Feeding regime:	0.15 mL brine shrimp nauplii concentrate twice daily
13. Aeration:	River and effluent initially to reduce DO supersat.
14. pH adjustment:	None
15. Cleaning:	Siphoning
16. Test duration:	7 days
17. Effects measured:	Survival and growth (biomass)
18. Endpoints:	IC ₂₅ at 7 days

	12/16	25.1	25.3	25.0

BIOLOGICAL PARAMETERS

Loading rate for the *P. promelas* acute test satisfied the ≤ 0.65 g/L range criterion for 20° C acute tests (Table 8). Primary and secondary controls for all acute tests met or exceeded the 90% survival criterion for an acceptable test (Tables 9-11).

C. dubia chronic test primary and secondary controls met or exceeded minimum performance criteria for an acceptable test, i.e., $\geq 80\%$ survival, ≥ 15 neonates/surviving adult, $\geq 60\%$ of surviving adults releasing a third brood within 7 days (Tables 12 and 13). *P. promelas* chronic test primary and secondary controls met or exceeded minimum performance criteria of $\geq 80\%$ survival and ≥ 0.25 mg average individual dry weight (Tables 14 and 15). Control performance and test endpoints are summarized in Table 16.

Table 8. Mean length and weight of juvenile fathead minnows used for the December 9-13, 1993 acute test.

Mean length =	13.30 mm
Mean weight =	15.45 mg
Loading factor =	0.21 g/L

Effluent Bioassays For
Flambeau Mining Company
Ladysmith, Wisconsin

(IPS Project 5000-611)

INTRODUCTION

This report presents the results of a biological assessment of treatment plant effluent quality conducted by Integrated Paper Services, Inc. (IPS). This study was conducted on behalf of Flambeau Mining Company (Flambeau) during the period of January 6-10, 1994, and represents the second of two retests subsequent to a positive acute toxicity result in the December 9-12, 1993, Wisconsin Department of Natural Resources (WDNR) split-sample test batteries.

An acute test format bioassessment was implemented to estimate the acute toxicity of outfall 001 effluent to the cladocerans, Ceriodaphnia dubia and Daphnia magna, and the fish, Pimephales promelas, using the definitive format of the U. S. Environmental Protection Agency (EPA) acute test protocols (1).

Acute toxicity in these tests is defined as greater than fifty percent mortality to C. dubia or D. magna at 48 hours exposure, or to P. promelas at 96 hours exposure. A positive test result is defined, by WPDES Permit, as acute toxicity in 100% effluent.

METHODS

IPS methods, including test organism culture, quality assurance, sample handling, test procedures, and data analyses were in accordance with EPA and WDNR procedures (1,2). These tests were undertaken as described in the QA/QC plan submitted pursuant to Flambeau's current WPDES Permit No. WI-00047376-1 and approved by the WDNR (changes from the original plan are in accordance with the December, 1992 modified permit).

SAMPLE COLLECTION AND PREPARATION

Effluent for the tests consisted of two 16-hour composite samples; control/dilution water was a Flambeau River grab sample. These samples were collected by Flambeau personnel (Table 1), kept cool and delivered to IPS within 37 hours of collection.

Sample temperatures were measured and recorded upon receipt; total residual chlorine was measured on and a NH₃-N sample taken [and preserved (3) if necessary] from effluent samples upon receipt. Samples not used immediately for test initiation or solution

renewal were placed in cold storage (4° C) until needed. All samples were filtered through a 63μ mesh sieve to remove interfering organisms prior to test use.

Table 1. Sample collection schedule for Project 5000-611.

Sample	Type	Collection Dates	Test Use Days
Effluent	16-hr Comp.	1/4	Acute(1-2)
Effluent	16-hr Comp.	1/5	Acute(3-4)
Flambeau River	Grab	1/5	Acute(1-4)

LABORATORY ANALYSIS

Bioassay test procedures followed acute bioassay protocols and special requirements (1,2); chemical parameter measurements followed the equipment manufacturer's instructions or A.P.H.A. methods (3). Test conditions are summarized in Tables 2-4.

Dissolved oxygen, pH, and conductivity were measured initially and after 24-hours exposure on all test solutions. Total hardness and total alkalinity were measured daily on the control and highest effluent concentration renewal solutions. Test temperature was monitored hourly by thermocouple thermometry in the exposure areas.

Acute tests were concluded by counting the surviving organisms in each test chamber. In addition, the surviving secondary control fish were sacrificed (exposed to 70% ethanol) and total length and wet weight measurements were made to determine the loading rate.

TEST VALIDATION AND RESULTS

PHYSICOCHEMICAL PARAMETERS

Effluent temperature upon receipt at the laboratory was $\leq 1.2^{\circ}\text{ C}$. Dechlorination of effluent samples was not necessary (total residual chlorine $< 0.02 \text{ ppm}$). Physicochemical parameters measured as part of the bioassays satisfied requirements for aquatic life and the bioassays (1,2). Test temperatures were within protocol specified ranges (Table 5). Chain-of-custody forms with sample collection information, chemical data sheets, and laboratory bench sheets are appended to this report.

BIOLOGICAL PARAMETERS

Loading rate for the P. promelas acute test satisfied the ≤ 0.65 g/L range criterion for 20° C acute tests (Table 6). Primary and secondary controls for all acute tests met or exceeded the 90% survival criterion for an acceptable test (Tables 7-9).

Table 2. Summary of test conditions for the acute toxicity test with Ceriodaphnia dubia.

1. Test organism:	<u>Ceriodaphnia dubia</u> (Crustacea:Cladocera)
2. Test type:	Static renewal
3. Age of test organisms:	Less than 24 hours
4. Test chamber size:	30 mL
5. Test solution volume:	15 mL
6. Renewal of test solutions:	Daily
7. Replicate chambers/treatment:	4
8. Test organisms/chamber:	5
9. Control/dilution water:	Primary - Flambeau River Secondary - Flow-through culture water
10. Effluent test concentrations:	6.25, 12.5, 25, 50 & 100% (v:v)
11. Temperature:	20 +/- 2° C
12. Feeding regime:	None
13. Aeration:	River and effluent initially to reduce DO supersaturation
14. pH adjustment:	None
15. Test duration:	48 hours
16. Effects measured:	Mortality (immobilization)

Table 3. Summary of test conditions for the acute toxicity test with Daphnia magna.

1. Test organism:	<u>Daphnia magna</u> (Crustacea:Cladocera)
2. Test type:	Static renewal
3. Age of test organisms:	Less than 24 hours
4. Test chamber size:	100 mL
5. Test solution volume:	50 mL
6. Renewal of test solutions:	Daily
7. Replicate chambers/treatment:	2
8. Test organisms/chamber:	10
9. Control/dilution water:	Primary - Flambeau River Secondary - Flow-through culture water
10. Effluent test concentrations:	6.25, 12.5, 25, 50 & 100% (v:v)
11. Temperature:	20 +/- 2° C
12. Feeding regime:	None
13. Aeration:	River and effluent initially to reduce DO supersaturation
14. pH adjustment:	None
15. Test duration:	48 hours
16. Effects measured:	Mortality (immobilization)

Table 4. Summary of test conditions for the acute toxicity test with Pimephales promelas.

1. Test organism	<u>Pimephales promelas</u> (Osteichthyes: Cyprinidae)
2. Test type:	Static renewal
3. Age of test organisms:	Juvenile, 22 days
4. Test chamber size:	1 L
5. Test solution volume:	750 mL
6. Renewal of test solutions:	Daily
7. Replicate chambers/treatment:	2
8. Test organisms/chamber:	10
9. Control/dilution water:	Primary - Flambeau River Secondary - Dechlorinated tap water
10. Effluent test concentrations:	6.25, 12.5, 25, 50 & 100% (v:v)
11. Temperature:	20 +/- 2° C
12. Feeding regime:	None
13. Aeration:	River and effluent initially to reduce DO supersaturation
14. pH adjustment:	None
15. Test duration:	96 hours
16. Effects measured:	Mortality

Table 5. A summary of temperature data (date is start of 1200 hr to 1200 hr recording period) for Project 5000-611.

<u>Date</u>	<u>Mean</u>	<u>Max.</u>	<u>Min.</u>
1/6	20.3	20.5	20.1
1/7	20.1	20.3	19.7
1/8	20.2	20.3	19.8
1/9	20.2	20.3	20.1

Table 6. Mean length and weight of juvenile fathead minnows used for the January 6-10, 1994 acute test.

Mean length = 11.30 mm
Mean weight = 4.91 mg
Loading factor = 0.07 g/L

Table 7. Ceriodaphnia dubia survival data for the January 6-8, 1994 acute toxicity test.
